Lesson 2

Introduction

- ❑ A **transistor** is a semiconductor device that controls current between two terminals based on the current or voltage at a third terminal.
- ❑ It is used for amplification or switching of electrical signals.
- ❑ The basic structure of the bipolar junction transistor, BJT, determines its operating characteristics.
- ❑ DC bias is important to the operation of transistors in terms of setting up proper currents and voltages in a transistor circuit.
- ❑ Two important parameters are α_{DC} and β_{DC}
